

# **Emotion Regulatory Effects of Emotion and Content Labeling in a Naturalistic Context** Helen Schmidt & Chelsea Helion Department of Psychology & Neuroscience, Temple University

# Background

- Prior work has found that putting feelings into words<sup>1</sup> (emotion labeling) or categorizing external details<sup>2</sup> (content labeling) can reduce reported arousal and negative valence, but their generalizable effectiveness as emotion regulation strategies remains unclear, particularly in real-world contexts
- Moreover, in the context of self-regulation<sup>3</sup> and episodic memory<sup>4</sup> research, it is unclear how labeling influences recollection for emotional events
- This pre-registered work leverages naturalistic stimuli to investigate if emotion labeling or content labeling can effectively regulate negative emotions and examine how labeling impacts subsequent event recollection

### **Hypothesis** 1

n labeling will be the more effective regulation strategy, resulting in reduced arousal and increased valence ratings

### Hypothesis 2

Content of participant recall will be impacted by regulation strategy and order of strategies completed during the task

- emotions

## Results

## Conclusions

 Emotion and content labeling may be effective strategies to regulate low-intensity, negative

 Block strategy and block order impact free recall content

## **Future Directions**

- analysis techniques
- than block structure

 Investigate recall structure and content using additional NLP

Replicate task with randomized strategies across trials rather
